

This class will assign our name, initial Value, comment and date. Getters and setters are included in this class. getName will get the name from the user entering and set it to the name variable. Same with initialValue and Comment. setDate will set the date for the each counter.

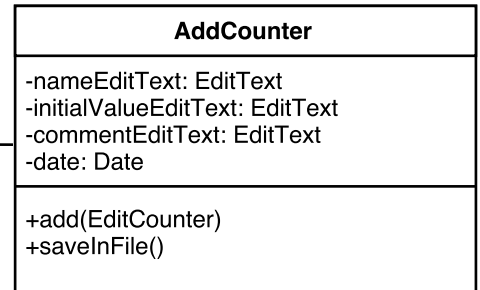

There could be many counters in 1 arraylist.

This EditCounter class will have the arrayList we will use to store our values. It will update and delete the values.

With this AddCounter class we will be able to add counter and enter the name, initialValue, comment and the date for each counter. We will save them in the file to use in mainactivity class.

The added counter will be stored in the arrayList.
